Disclaimer
The Coverage Summaries are reviewed by the Humana Medicare Utilization Management Committee. Policies in this document may be modified by a member’s coverage document. Clinical policy is not intended to preempt the judgment of the reviewing medical director or dictate to health care providers how to practice medicine. Health care providers are expected to exercise their medical judgment in rendering appropriate care. Identification of selected brand names of devices, tests and procedures in a medical coverage policy is for reference only and is not an endorsement of any one device, test, or procedure over another. Clinical technology is constantly evolving, and we reserve the right to review and update this policy periodically. References to CPT® codes or other sources are for definitional purposes only and do not imply any right to reimbursement or guarantee of claims payment. No part of this publication may be reproduced, stored in a retrieval system or transmitted, in any shape or form or by any means, electronic, mechanical, photocopying or otherwise, without permission from Humana.

**Description**

Ankylosing spondylitis (AS) is a chronic inflammatory disease. It is a type of arthritis that affects the spine. AS can cause pain, stiffness and inflammation from the neck to the lower back and, in severe cases, can cause the vertebrae in the spine to fuse together. No specific laboratory tests are required to establish diagnosis, however, HLA-B positive status helps to support the diagnosis. Plain radiography of pelvis and sacroiliac joints is the initial imaging method. There are no true diagnostic criteria; however, classification criteria have been developed and are frequently used to aid diagnosis. Diagnosis can be done using imaging or clinical criteria.

HLA-B*27 (human leukocyte antigen) is a specific protein located on cell surfaces. The term HLA-B*27 is also used to refer to the gene that codes for the HLA-B*27 protein. The HLA-B*27 test determines the presence or absence of HLA-B*27 protein on the surface of an individual's white blood cells.

HLA-B*27 was initially identified using serological methods to detect the presence of HLA-B*27 antigen; however, this methodology is no longer used by United States laboratories. Today, DNA-based molecular techniques are used such as polymerase chain reaction (PCR) with restriction fragment length polymorphism (RFLP) analysis, sequence specific primer (SSP) and/or sequence-specific oligonucleotide probe (SSOP).

**Coverage Determination**

*Humana follows the CMS requirement that only allows coverage and payment for services that are reasonable and necessary for the diagnosis or treatment of illness or injury or to improve the functioning of a malformed body member except as specifically allowed by Medicare.*

Genetic tests must demonstrate clinical utility, analytical and clinical validity and fulfill the CMS “reasonable and necessary” criteria. Analytic validity (test accurately identifies the gene variant), clinical validity (test identifies or predicts the clinically defined disorder) and clinical utility (test measurably improves clinical outcomes) of the genetic test is supported by generally accepted standards that are based on credible scientific evidence published in peer-reviewed medical literature generally recognized by the relevant medical community, specialty society recommendations, and views of physicians practicing in relevant clinical areas. The test must be ordered by a physician who is treating the beneficiary and the results will be used in the management of a beneficiary’s specific medical problem.
For jurisdictions with no Medicare guidance for a particular test, Humana will utilize the MolDX program and Technical Assessments for molecular assays as the standard to evaluate clinical utility, analytical and clinical validity in conjunction with adhering to Medicare’s reasonable and necessary requirement.

In interpreting or supplementing the criteria above and in order to determine medical necessity consistently, Humana may consider the following criteria:

Please refer to the above CMS guidance for molecular testing for HLA-B*27 for ankylosing spondylitis.

The use of the criteria in this Medicare Advantage Medical Coverage Policy provides clinical benefits highly likely to outweigh any clinical harms. Services that do not meet the criteria above are not medically necessary and thus do not provide a clinical benefit. Medically unnecessary services carry risks of adverse outcomes and may interfere with the pursuit of other treatments which have demonstrated efficacy.

### Coverage Limitations

US Government Publishing Office. Electronic code of federal regulations: part 411 – 42 CFR § 411.15 - Particular services excluded from coverage

The following tests may not be considered a benefit (statutory exclusion)⁷:

- Tests considered screening in the absence of clinical signs and symptoms of disease that are not specifically identified by the law; OR

- Tests that confirm a diagnosis or known information; OR

- Tests to determine risk for developing a disease or condition; OR

- Tests performed to measure the quality of a process; OR

- Tests without diagnosis specific indications; OR

- Tests identified as investigational by available literature and/or the literature supplied by the developer and are not a part of a clinical trial

These treatments and services fall within the Medicare program’s statutory exclusion that prohibits payment for items and services that have not been demonstrated to be reasonable and necessary for the diagnosis and treatment of illness or injury (§1862(a)(1) of the Act). Other services/items fall within the Medicare program’s statutory exclusion at 1862(a)(12), which prohibits payment.

The following services/items will not be considered medically reasonable and necessary:
• Genetic tests that have not demonstrated clinical utility, analytical and clinical validity via the MolDX Program, OR

• HLA typing prior to standard work up for AS (blood work, family history, physical examination, radiography or MRI)

A review of the current medical literature shows that the evidence is insufficient to determine that this service is standard medical treatment for these indications. There remains an absence of randomized blinded clinical studies examining benefit and long-term clinical outcomes establishing the value of this service in clinical management for these indications.

Summary of evidence:

Evidence shows that while many individuals with AS carry the HLA-B27 gene variant, testing positive for it does not mean the individual will develop AS.\textsuperscript{8} There are no true diagnostic criteria; however, classification criteria have been developed and are frequently used to aid diagnosis.\textsuperscript{2} Diagnosis can be done using Assessment of SpondyloArthritis International Society (ASAS) imaging or clinical criteria. To fulfill the imaging criteria, patients must have radiographic or MRI evidence of sacroiliitis plus at least 1 spondyloarthritis feature. To fulfill the clinical criteria, patients must have HLAB27 plus at least 2 separate spondyloarthritis features. ASAS spondyloarthritis features include the following:

- Arthritis
- Dactylitis (inflammation of a digit [either a finger or toe])
- Good response to nonsteroidal anti-inflammatory drugs
- Elevated C-reactive protein
- Enthesitis of the heel
- Family history of spondyloarthritis
- History of inflammatory back pain
- Inflammatory bowel disease
- Presence of HLA-B27
- Psoriasis
- Uveitis (inflammation/swelling of the colored portion of the eye)\textsuperscript{6}

Coding Information

Any codes listed on this policy are for informational purposes only. Do not rely on the accuracy and inclusion of specific codes. Inclusion of a code does not guarantee coverage and/or reimbursement for a service or procedure.
